

Abstract of the Disclosure

5 A networked-based system for providing online verification of users
applying for third-party services available through the network is provided.
The system employs a first server node connected to the network for
offering application to third-party services through the network, a user node
connected the network for accessing the first server node and applying for
third-party services, a second server node connected to the network and
10 accessible from the first server node, the second server node for processing
verification requests communicated from the first server node, a third server
node connected the network and accessible from the second server node, the
third server node for navigating on the network by proxy according to
navigation requests communicated from the second server node and a data
15 repository accessible at least to the second server node for storing data
about users being verified. A user operating the user node accesses the first
server node and applies for a service or services offered through the first
server node and submits data for verification, the first server node sending
the data in the form of a verification request to the second server node, the
20 second server node creating a navigation request containing a portion of the
submitted data and sending the navigation request to third server, the third
server performing the navigation according to the request and reporting
navigation results back to the second server, the second server reporting the
results back to the first server for verification purposes.
